Chapter 1

Introduction

Chapter 2

Data

2.1 DWD Radar Data

Boostedt DWD radar site: 54.0055° N, 10.04683° E, 124.6 m height

Precipitation scan: 0.5° ,following orographie (150 km range) 250m range gates, 1° azimuth steps 5 minute time resolution C-Band 100 km x 100 km box around PATTERN radar position taken from the whole radar image

2.2 PATTERN Radar Data

PATTERN Hamburg radar position: 53.56833° N, 9.97997° E, 80m height

60m range gates, 1° azimuth steps (20 km range) 30s time resolution X-Band

Chapter 3

Methodology

3.1 Prognosis Model

3.1.1 Setting of Parameters

3.1.2 Gridding and Coordinate Transformation

Both the DWD and PATTERN radar data are initially in a polar grid around their respective radar stations. For simplicity and nesting/comparability between both radars, the data is transformed and gridded to a Cartesian grid.

This is done by using the Transverse Mercator projection transforming the polar grid coordinates to a Cartesian grid. The Transverse Mercator projection divides the Earth into 60 zones with 6° longitude in width. This reduces the distortion due to the curvature of the earth. Hamburg and its surrounding area lies in the EPSG zone 32632.

$$Z = 10 \cdot \log_{10}(z) \tag{3.1}$$

$$z = aR^b \tag{3.2}$$

$$R = \frac{Z^{\frac{1}{b}}}{a} \tag{3.3}$$

a and b are empirically-derived parameters. DWD and PATTERN use following values

for different radar reflectivities:

$$\begin{aligned}
 Z \leq 36.5\text{dBZ} : \quad & a = 320, b = 1.4 \\
 36.5\text{dBZ} < Z \leq 44.0\text{dBZ} : \quad & a = 200, b = 1.6 \\
 Z > 44.0\text{dBZ} : \quad & a = 77, b = 1.9
 \end{aligned} \tag{3.4}$$

3.1.3 Interpolation Methods

Barycentric Interpolation

Bilinear Interpolation

$$f(x, y) = Af(x_1, y_1) + Bf(x_2, y_1) + Cf(x_2, y_2) + Df(x_1, y_2) \tag{3.5}$$

3.1.4 Displacement Detection

3.1.5 Importance Sampling

3.2 Evaluation Methods
